CHINESE CABBAGE

東洋種物株式會社白菜種子畑の一部（支那保定府在）

Acres of Chinese Cabbage on Our Paoting-fu Farm in Chili, China

The culture is the same as for spinach or lettuce. The seed should be sown any time after May and for main crop from July to September, $\frac{1}{4}$ inch deep in the row and rows about 24 inches apart. When the plant has grown up 5 to 6 inches thin out to 10 inches apart. Cultivate well and when large enough they should be blanched by earthing up and tying closely with burlap. Any good soil is sufficient, but they seem to head up best in rich black adobe soil. One ounce of seed is enough for 500 feet of drill.

“Paoting” genuine Wong-Bok

(REGISTERED BRAND) (銹球白菜)

Big compact tender and crisp. An excellent "Wong Bok." We have found this to be absolutely the best firm-heading "Chinese Cabbage" to grow during the summer months. It will not scald or burn and will make a head when other varieties fail. It somewhat resembles "Kinshu" in shape and "Shantung" in character of leaf, color and size, but the head is more tightly compacted. It will produce a head of 15 pounds and will stand long before bolting to seed. It is excellent in quality: crisp, tender and brittle, with a fine celery flavor. We recommend it either for the market gardener, trucker or private planter, as it is a perfect "Chinese Cabbage" in every respect, not only being in the largest size, but of handsome color and of the finest quality. It is probably the safest variety for an amateur to plant as it does well at all seasons and one is almost sure of getting a crop. It is vigorous and free from insects. (Pkt. 10c.) (Oz. 40c.) (4 Ozs. \$1.25) (lb. \$4.50) (2 lbs. \$8.00) postpaid. This seed grown in our Potingfu Farm, in Chili, China.

 “PEKING” genuine PE-TSAI
 (REGISTERED BRAND)

The grand variety of Pe-Tsai strain of Chinese Cabbage grow as much mammoth size as 15 to 20 inches tall, 10 to 12 inches in diameter and weighting up to 15 pounds a head in maturity. The crown is not so solid as Wong-Bok strain, but grow narrow and large head.

The interior blanches creamy-white, crisp and delicious, and of that desirable rich celery flavor. It produces successfully throughout the year and is considered one of the best late fall and winter Pe-Tsai. It is a good keeper and shipper and its attractive appearance and fine quality make it one of the best sellers. We can say without exaggeration that this is the finest Pe-Tsai in existence to day. Whether for medium early, main crop, or late use, it has no equal, and is so finely bred and so true to type that in a field of several acres every head appears alike. (Pkt 10c. Oz 40c.) **Why Not Feed Your Poultry Chinese Cabbage "Peking" Genuine Pe-Tsai
Green Feed Without Discoloring The Yolks**

The wonderful Green Feed for Poultry from China which has been known to yield 3 tons in a space 40 x 60 feet with one half ounce of seed.

You can't beat this for Cleap Green Feed. A half pound of this seed will furnish enough green to feed about 1,000 hens for 4 months and 3 pounds to an acre for 6,000 hens for 4 months.

に 特 効 The culture of this Chinese Cabbage "Peking" genuine Pe-ktai is similar to that for spinach, lettuce or wisschard. Transplant is not required. Sow seed in open ground and time after frost is over (except early spring) for main crop in July to September, in rows a quarter inch deep and 21 inches apart each way, allowing about 2 inches between the seeds. Cultivate and irrigate ground well. **Do Not Allow Ground To Dry Out.** Chopping is Not Required Even for Young Chicks.

A detailed black and white line drawing of a Peking cabbage plant. The main plant is large and mature, with a dense, rounded head of leaves. To its right, a smaller, younger seedling is shown, also with a developing head. The plants are growing in a field with some other vegetation in the background.

Commence feeding "Peking" genuine Pe-Tsai, when plants are about 4 inches high by pulling out and feeding alternate plants. Continue thinning until plants are about one foot apart. These should make heads of five to seven pounds in 60 days and may be fed immediately or allow to stand in the ground until so late as January in most Pacific coast localities. These heads may be fed whole as they are very tender and 100 per cent edible.

Our Chinese Cabbage "Peking" Genuine Pe-tsai is registered brand and is grown in our Foating-farm in Chili, China under our Person I supervision and you may depend upon this imported seed of high germination, pure and respectively true to name.

大根 Rabanoso Rabanitos RADISH (ラデシユ) 大根

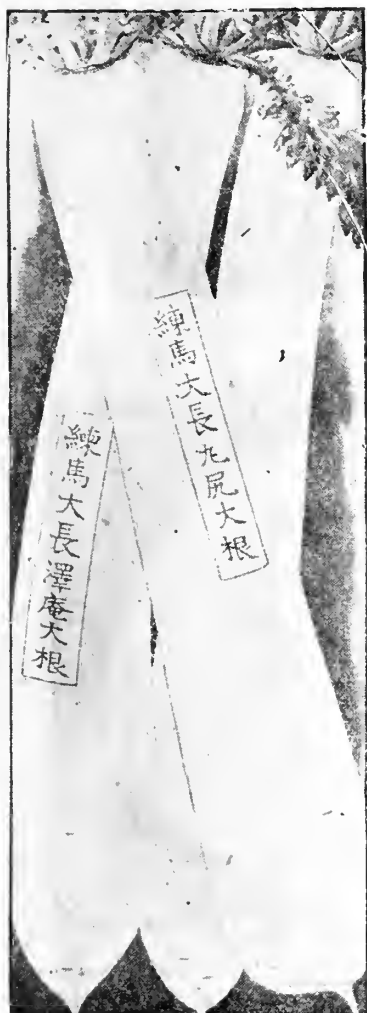

No garden is complete without radishes in succession at all times. They are no trouble, have no pests, and mature in a month and a half. Crimson Giant Forcing, Icicle and Half Long are all very solid varieties. Use two-thirds ounce for 100 feet of row, and thin the very young plants somewhat to prevent crowding. Summer varieties can be sown all Spring and well into Summer. Winter varieties, however, require some time to mature, and the seed should be planted in August and September for good radishes in November and December.

JAPANESE RADISH or "DAIKON" (大根)

DAIKON—Is surely one of the Oriental wonderful vegetables. They grow to immense sizes. Picture to yourself a pure white radish 1 to 3 feet in length, about 10 inches in circumference, and 2 to 10 pounds in weight, and some grow round, like a baseball, to about 20 to 30 pounds in weight. It has the flesh of Baldwin apple and is as fine as a grain, and you will find it flavored a head of the best spring radish that ever passed your lips. It is excellent boiled with meat or used in vegetable soup, it is also good in oyster stews. By all means try this strains and you will be surprised at the real value of these wonderful radishes. It will thrive at any season during the growing year, however some variety do better at certain season as one will see by reading the following descriptions of the variety which we introduce as being the best for local conditions. Sow in drill 20 to 24 inches apart and when 3 to 6 inches high thin out 10 inches in row. Japanese radish should be grown in light, rich loam soil well worked. Water once a fortnight during cool weather and once a week during the warmer months. They mature in between 60 to 120 days. Six pounds will sow an acre.

NERIMA-LONG or MIKADO (ネリマ大長丸尻大根)—This is the leader of Japanese radish and the taste will immediately convince anyone of the fact that it is not merely a curiosity but a radish of extraordinary quality, large and long (as long as 3 feet) and 2 to 3 inches in diameter, and the end of the root is round in form, snowy white and bright color and very fine taste with sweet flavor. NERIMA can be used in many ways of cooking and pickles, hardy and good keeper. We have had long experience production of NERIMA-LONG successfully and we are earnestly presenting this to all good farmers and garden lovers. Try it this year and you will find a big, interesting crop in a few weeks. For main crop sow according to the following schedule. San Francisco and vicinity, early August; Southern States, late August; Northern States in early July. (Pkt. 10c.; oz. 20c.; 4 ozs. 60c.; lb. \$1.75; 2 lb. \$2.80) postpaid. Imported seed.

MIYASHIGE (宮重太長大根)—Grows more than two feet long and over 3 inches in diameter. And are very richly formed; solid and fine sweet flavor. Skin is a beautiful white and green in top. Keeps well, firm and crisp for a long time. We recommend our selection of this as being an extra good cooking radish. In Japan it is generally cut into small pieces and dried in the sun and keep for a long time. Grows easily everywhere, for the main crop saw to schedule of NERIMA-LONG. (Pkt. 10c.; oz. 20c.; 4 ozs. 50c.; lb. \$1.50; 2 lbs. \$2.40) postpaid. Imported seed.

Col repollo CABBAGE (キャベチ) 甘 藍 カンラン

It is difficult to give definite cultural directions for cabbage, since it is possible to have good cabbage at all seasons of the year in some part of the country. Seed may be planted almost any time of the year. However, there are the seasons preferable for sowing—in September for early spring cabbages, from January to April for summer and fall cabbages, and July to August for winter cabbages. Sow the seed $\frac{1}{2}$ inch deep and transplant the early varieties to rows 24 inches apart and 18 inches apart in the rows. They will mature in about 105 days. The late varieties mature in about 150 days and should be planted in rows 30 inches apart and 24 inches apart in the row. To prevent the heads from splitting open before they are ready to be harvested, in the plants should be loosened a little at the root. Cabbages require plenty of moisture, but too much water causes them to rot very readily.

Postpaid.

One ounce will produce 1,000 plants and will mature in about 150 days. Sow as directed for cabbage, and set the plants in rows 2½ feet apart and 2 feet apart in the rows. CELERY (セルリー) Apios

CULTURE.— Celery requires abundant moisture at all stages of growth but will not endure flooding for any length of time. The seed is sown from February to May in beds either drilled or broadcast. The seed must be planted very shallow—is slow to germinate and the beds must be kept wet. The beds can be covered with old burlap sacks until the plants begin to come to the surface when the sacks must be removed at once. The seedlings will be ruined if the sacks are left even one day too long. After the seedlings are well started they may be transplanted or thinned out to give them room to make stocky plants. If broadcast, 2 to 3 inches each way or if in drills, 1 inch apart in six inch drills will give strong plants—usually 3 months will be required from seed to produce a plant ready to transplant into the field.

Celery plants are usually set out about 7 inches apart in rows 3 or 3½ ft. apart. Frequent cultivation and irrigation is necessary and abundant fertilizer must be used unless the soil is exceptionally rich. As the plants approach maturity they must be blanched by hilling up with earth or with boards or special blanching paper.

Keep the weeds down, and when the thickened stems above ground are 2 or 3 inches through they are fit to eat, and should be used at once, being tough when old. Cook same as turnip.

One ounce will plant 80 hills; 2 pounds will plant an acre. A light, warm, rich soil is essential for this crop. Plant in hills 6 feet apart each way, using 5 to 8 seeds in the hill. After all danger of destruction by bugs is over, thin out to 3 plants to a hill. When about 1 foot long, pinch off the tips to make them branch. WATERMELONS Zandia ウオタメロン (西瓜)

A light, sandy soil, with good exposure to the sun, is the best for watermelons. It should be prepared deep, but receive shallow cultivation. Hoe often and thoroughly. To get good, strong vines early in the season, from large, well-drained hills of earth, made very rich, about 8 feet apart. In these plant the seed as soon as the ground is warm and dry, dropping 6 to 10 seeds in the hill. Protect the young plant from insects. One oz. to 30 hills, 3 lbs. to the acre. When the plants are about 4 inches high thin out, leaving only four of the strongest plants to each hill.

KLONDYKE (クロンダイク)—A great favorite of recent introduction. Oblong, dark rich green, flesh bright red, very crisp and sweet. We first offered the Klondike watermelon in 1914. It gained in popularity each year, first in one market then another. On account of the thin rind and extreme crispness the shipper was slow to accept it. But its extreme popularity impelled the shipper to grow it. Each year a larger acreage was planted, bringing greater profit to the grower. Although having a very thin rind it is a better shipper because it does not wilt. We now feel that the Klondike has fairly won the title. "The Prince of all Watermelons." The seed is small. One pound of Klondike will number as many seeds as two pounds of other varieties. The color of the seed is brown, mottled black. (Pkt., 10c.) (oz. 25c.) (1/4 lb. 75c.) (lb. \$2.50) (2 lbs., \$4.00).

BLACK SEEDED CHILIAN (ブラツクシデツトチリアン)

CHILIAN (チリアン)—A very desirable melon for the home garden; of medium size, nearly round; skin is deep green, faintly mottled and striped; flesh is bright red fine grained and very sweet. (Pkt., 10c.) (oz., 20c.) (1/4 lb., 45c.) (lb., \$1.25) (2 lbs., \$2.00) postpaid.

GOLDEN HONEY (ゴールドンホネー)—A delicious melon with yellow flesh, solid and sweet right up to the rind. Fruit oblong and medium sized. (Pkt., 10c.) (oz., 20c.) (1/4 lb., 50c.) (lb., \$1.50) (2 lbs., \$2.40) postpaid.

FLORIDA FAVORITE (フロリダ フェボリット)—A splendid melon of very large size and excellent quality. Fruit long, dark green, mottled and striped with lighter shade; rind thin but firm. Flesh bright deep red; very sweet and tender. (Pkt. 10c.) (oz., 20c.) (1/4 lb., 45c.) (lb., \$1.25) (2 lbs., \$2.00) postpaid.

ANGELINO (アンゼリノ)—A round deep green melon, rind very thin, flesh deep red and of fine flavor a good shipper. (Pkt., 10c.) (oz., 20c.) (1/4 lb., 45c.) (lb., \$1.25) (2 lbs., \$2.00) postpaid.

大冬瓜

KOLB'S GEM (コルプス ゼム)—A very large round or slightly oval melon. Rind exceedingly hard and firm, making it one of the best round sorts for shipping. Flesh bright red, sweet and tender; black seeded. (Pkt., 10c.) (oz. 20c.) (1/4 lb., 45c.) (lb., \$1.25) (2 lbs., \$2.00) postpaid.

Tom Watson Watermelon
(タム ワツソン ウオタメロン)

TOM WATSON (タムワツソン)—It belongs to the large type of melons, with grow from 50 or 75 pounds. It is oblong in shape. The meat is dark crimson red, deliciously crisp and sweet and fine flavor. It is especially prolific and attractive. Chinese Watermelon (大冬瓜)

ZIT-KWA (大冬瓜)—A Chinese cooking water-melon, seems destined to have a vogue in this country. It is valuable for stew or soup or peel off minced to good size and boiled and served as a fine salad with little sauce and mustard. Mushroom Spawn

Cultural Directions
マツシ ルーム スポーン (茸の種子)

Ten pounds will spawn about 10 feet square. Mushrooms can be grown in any dark room or cellar where the temperature can be kept at from 50 to 70 degree. From some old pasture procure good, rich soil, and to every bushel of this soil add 2 bushels of fresh horse manure. Of this well-mixed compound prepare a bed, say, 4 feet wide. Put down a thin layer and pound it down hard, and go on until you have a bed 12 or 18 inches thick. As soon as the temperature of the

bed falls from 75 to 50 degrees, the spawn may be inserted in pieces about the size of a walnut, about 2 inches deep and 6 inches apart. Cover with loamy soil about 2 inches deep and beat it down evenly and firmly. Finish off with a covering of clean hay, about a foot thick, and the work is done. If the temperature is right, in 6 or 8 weeks you may expect mushrooms. The beds will continue bearing from 20 to 30 days. After the first crop is gathered spread over the bed an inch of flesh soil, moisten with warm water, and cover with hay as before. The main conditions in mushroom growing are proper and uniform temperature and very rich soil.

CHINESE BUTTER BEAN GOURD—One of the Chinese Curiosity and is a member of the edible gourd family and in growth is similar to the squash, and can be grown in the same manner or can be trellised up. It is wonderfully prolific, considerably more productive than squash and much easier to grow. The vines are always free from disease and insect pests, and really stand more neglect and abuse than any other vegetable vine we know of.

Fruit grow to four, five feet long and 4-5 inches in diameter, which combines the flavor of the delicious marrow with the finest French beans. To serve, take fresh from the vine, a young gourd bean about 15 inches long or smaller, while the fuzzy growth is yet on. Cut into cubes about an inch, bring to a boil, pour off the water twice. Season well with salt and pepper and butter. You will be surprised how it is. Extremely economical. Culture is same as for cucumbers or squashes. (Pkt. 10c.) (Oz. 25c.) (1/4 lb. 80c.) 豌豆 PEAS Chicharos o Gaisanthes ピース 豌豆

A light, dry soil, not over rich, suits the Pea. If they grow too vigorously and show no signs of bloom, run a spade along about eight inches from the row straight down, and thereby root prune them. Do this each side the row, and they will bloom in a few days. Plant as early as the ground can be worked, and again every two weeks for succession throughout the season. Plant single or double rows from four to six feet apart, according to the different heights, about an inch apart in the row and three inches deep; hoe often. or VEGETABLE OYSTER

A loose, light soil, especially sandy loam, is desirable for a long, smooth root. In stiff soils the roots are usually uneven and hard to dig. Use one ounce for 100 feet of row, and thin to two inches to prevent crowding. Plant in 12 inch to 15 inch rows.

12. MAMMOTH SANDWICH ISLAND (マンモス、サントイチ、アイランド) The improved large-rooted variety, growing about 12 inches long and being from 1 to 2 inches thick. (Pkt. 10c.) (Oz. 25c.) (1/4 lb. 85c.) (lb. \$2.50) postpaid.

An easily grown plant, the seed of which may be planted in the fall to secure good spinach early in the spring or even throughout the winter. For the home garden use one ounce for 100 feet of row.

LONG STANDING (ロングスタンディング)—A deep green variety with rather elongated smooth leaves. Seed round. Stands a long time without running to seed even in hot weather. (Pkt. 10c) (1/4 lb. 20c) (lb. 60c.) (2 lbs. \$1.00 postpaid.)

VIROFLAY (ヴィロフレ)--This variety has become popular as an allround Spinach. It is desired by the grower because it is hardier than other varieties and will produce in tonnage per acre more than any of them. The canner and shipper like it because of its large mouth leaves.

The consumer perters it because it is exceedingly tender and of mild flavor. (Pkt. 10c.) (1/4 lb. 20c.) (lb. 60c.) (2 lbs. \$1.00 postpaid.

Tendre Annuals' in Two Distinct Classes

Tall or Climbing and Dwarf

The foliage of nasturtiums is pretty and the flowers very beautiful and contained in a great number of brightest colors and tints. Sow the seed where it is to remain late in the Spring after danger of frost is over.

It is seldom necessary to thin the young plants, as they will bear standing close together.

Nasturtiums prefer dry, rather rocky soil, such as we usually call "poor" soil, and bear their flowers in such locations in greater profusion than in a rich garden, where they run too much to leaves. This adds to their value for planting over many unsightly places.

EARLY FLOWERING SPENCER (早咲)

This splendid group has justly earned signal recognition from a great body of American planters, particularly from the commercial growers for forcing under glass. It deserves more attention from the home gardener who has possibly been disappointed in his results with the later sorts, as it comes into bloom from three to four weeks earlier and therefore should be well in flower before our summer heat arrives. Besides they enjoy a very long blooming season and where cool nights are the rule they will continue to bear for months. The vines are less branching than those of the late Spencers but the blossoms are equally large, beautifully waved and carried on splendid long stems. They are ideal for late fall planting and where the winters are mild, as in our Gulf States, those bordering on the Rio Grande or in California they are used in large quantities at that season of the year.

THE ROSE ローズ

December, January, February and March are the best months for planting but should the season be favorable you can still plant during the early part of April. The plants sent out during these months are what we call dormant two-year-old budded plants. Roses give best results when planted in a fairly sunny location and in good heavy sediment soil to which may be added some old manure or bone meal, but never use fresh manure. When planting straighten out all roots and as the dirt is filled in see that it is well packed around them; this keeps out the air and encourages a new growth of rootlets. Be sure that the Rose is planted so that the point where it is budded shall be just below the surface.

Tree and Shrub Seeds 庭木の種子

Most tree seeds are better sown in the latter part of winter or spring, though there are many that can be sown at any time, and some which must be sown while the seeds are quite fresh. Most kinds are best sown in boxes, of light, well-drained soil, covering the seed about its own depth or some of the larger ones a little deeper, press the soil down slightly with the hands. Keep in a lath house, frame, or some sheltered place and water carefully. As soon as large enough to handle, pot and grow on until large enough to plant in the open ground, where they are to remain. Pines and other Conifer seeds are best sown in March and April, use a soil containing plenty of decomposed granite and always water in the morning and not at night, as the young seedling "damp off" very easily. Acacia seeds should be soaked in hot water for twelve hours or more before sowing.

KONO INSECTICIDE MIXTURE

"KONO" Insecticide, A-3—This new invention has the power of killing certain insects where other remedies have failed. It is very effective for use in garden, truck farms, and flower nurseries, especially for the control of red spider, aphid, caterpillar, white and green fly, thrip, also against snails and slugs.

This form of liquid spray will be found to be very much more effective than the dry, or powder sprays, because the liquid made more "CARRYING" by the soap bubbles, will cover, and cling to the under as well as the upper surfaces of the leaves, also, it will not blow off as will the powder form of insecticide spray.

DIRECTIONS FOR USE

Use 1/2 pound A-3 "KONO" Insecticide in fifty gallons of water. If necessary, stronger solutions may be used down to twenty-five gallons of water without injury to plants, vegetables, or trees (five teaspoonsful for one gallon of water).

Japanese Giant Chrysanthemums 日本秋菊

The Chrysanthemum is the queen of autumn flowers. Nothing is more beautiful as house plants, in the late fall and early winter, than these large, fluffy, Japanese varieties. For massive blooms, grandeur of colors, ease of culture and certainty to flower there is no plant that will surpass them. The endeavor of nearly all growers has been, in late years, to introduce varieties which will produce the largest and finest blossoms for exhibition purposes. It is from these varieties that this seed is saved. These plants are easily raised from seed. Almost all the new and striking varieties are the result of plants grown from seed, and the amateur is as liable to originate new and splendid varieties as is the professional florist.

They are of the easiest culture and always give satisfaction as house plants. The blossoms you get will surprise you with the odd and beautiful forms of the flowers and abundance of bloom. If you want a magnificent collection of these gorgeous Chrysanthemums—red, white, yellow and pink—you will make no mistake in getting a packet of our select seed.

We sell the seed in packets only, and guarantee it to be from the genuine large flowered Japanese varieties, imported seed. (Pkt. 25c.; 3 pkts. 60c.; postpaid).

Choice Chrysanthemum Plants

Set out the plants about 2 feet apart in well fertilized ground. After the young plants have grown 2 inches pinch them back 4 inches, then each plant will send out from 3 to 4 stems. In order to give strength to the blossoms, cover the ground with a layer of an inch or two of decayed manure. As soon as the buds appear on the stems, let the largest remain and pinch off all others.
